IPR11/98: Progress Toward A Maintenance Resource Management Measurement Profile

Executive Summary

This is an interim report on the current output of the MRM evaluation research program. During 1998 this research program has used new and existing data to create an important tool for the development and improvement of "maintenance resource management" (MRM). Thousands of surveys completed by participants in airline MRM training and/or behavior change programs have, for the first time, been consolidated into a panel of "MRM Attitudes and Opinion Profiles." These profiles can be used to compare the attitudes about decision making and communication in any given company at any stage in its MRM program with attitudes of a large sample of like employees during a similar period in their MRM involvement. This panel of comparison profiles for attitudes and opinions is a tool to help audit the effectiveness of a maintenance human factors program. The profile panel is the first of several tools envisioned for applying the information accumulating in MRM databases produced as one of the program's long range objectives. It is described in detail below.

Background

Research activities in the field of "macro" human factors in aviation maintenance since the early 1990s indicate that many airlines have opted to improve communication and professionalism, together with awareness of decision-making, employee participation, and effective safety systems (together called "Maintenance Resource Management," or MRM). Most of these airline MRM efforts have focused on training employees – some emphasizing training mechanics and others training both maintenance management and AMTs. In both cases, the training has succeeded in achieving initial and significant attitude changes among the participants. On the other hand there is little evidence that behavior change follows the initial attitude improvement. An extensive evaluation of the implementation of human factors-safety initiatives indicates that efforts to implement these good ideas and to build on the initial good will have largely stalled.

Support for this research program to evaluate MRM comes from a joint interagency agreement between the National Aviation and Space Administration's (NASA) Ames Research Center (ARC) and the Federal Aviation Administration's (FAA) Office of Aviation Medicine (AAM). This program was conceived in response to a congressionally mandated requirement (Aviation Safety Research Act, Pl.100-591, 1988. The goal of the

MRM evaluation research program is to provide information about organizational effectiveness to help achieve significant reduction of aircraft maintenance accidents and incidents caused by lapses in human communication and coordination. Without such effort, the limitations of human performance, and programs to improve it, will continue to be taxed by an increasingly demanding environment.

This research program is a university-industry-government-labor partnership that involves numerous airline operators, maintenance facilities, universities, research laboratories, and government agencies worldwide. It is planned, integrated, and coordinated with the FAA/NASA Aviation Safety Program (ASP). The research program has earned the reputation of representing the "real world" of aviation maintenance and addressing maintenance human factors issues accordingly. It has raised the awareness of the importance of human factors to the aviation industry, and additionally serves a number of organizations that have introduced MRM programs, some of which have been specifically designed to reduce maintenance errors

Through this partnership, the research program has evaluated, and measured a variety of airline programs to encourage the application and use of open communication and professional behavior to improve safety among aviation maintenance personnel. Most of these airline efforts have focused on training employees – some emphasizing training mechanics and others training both maintenance management and AMTs. A smaller number of programs have attempted to improve communication by initiating structured activities, sometimes accompanied by communication training. In all cases we have employed standardized measures of attitudes, opinions and behaviors to track and evaluate the effects of the programs. Since February 1998 the research program has entered into its databases some 9,000 surveys completed by MRM training participants. This year's survey data have been, combined with the 19,000 surveys contained in the program's databases from prior years [Taylor, 1997]. This year, for the first time, this combined database has been used to create a template of "typical responses" (i.e., a normative profile) to which any airline or repair station can compare its own workforce at any stage in its MRM program.

Since 1991 the attitudes, opinion and self-reported intentions and behaviors associated with MRM interventions have been analyzed by our research program. The raw data for that analysis has been provided from time-series surveys conducted by the airlines themselves, using several standardized questionnaire items agreed-to in advance. In our analyses, these questions are used singly or combined into Likert-type scales [Sellitz, et. al. 1976, pp. 418-421] to assess the degree of improvement achieved by the airlines' various MRM programs. Together these items are called the Maintenance Resource Management/Technical Operations Questionnaire (MRM/TOQ). Ideally each airline surveys its MRM participants before an intervention begins for a given sample population ("baseline"), immediately prior to a planned MRM intervention ("pre-"trial). Immediately following the intervention ("post-"trial), as well as various time periods following the intervention ("two-month," "six-month," and "12-month" follow-up surveys). These time-series data points have been previously used only to compare a single airline's results over time. They have now been recombined to yield normative profiles.

Profiles and profile analysis are highly useful ways to study and audit group scores (Kerlinger, 1979, pp 272-274). A profile is a set of scores from a set of measures. Group profiles used here are average scores obtained from a group of scores. The profiles created in the present case can be used by converting scores of the group to be compared or assessed to standard scores – the difference between the individual means for that group and the mean scores in the normative profile for the larger population, suitably adjusted for the variability of the population.

The Normative Profiles

Combining, by each period in the data collection time series, the appropriate responses from all of the companies measured using the MRM/TOQ; and characterizing their statistical properties, provides and prescribes a norm (or standard for comparison) for each time period. The data in each time period thus provides its own profile:

- a “baseline” profile (a comparison standard to use before an intervention begins for a given sample population);
- a “pretrial” profile (a standard for comparison immediately prior to a planned MRM intervention);
- a “post-trial” profile (for comparison of MRM/TOQ results immediately following intervention);
- a “two-month follow-up” profile, as well as “six-month,” and “12-month, follow-up” profiles (MRM intervention comparison profiles for responses gathered up to a year afterwards).

In each of the five sections that follow, the population profiles are shown only for a selected subset of the raw data – six attitude and opinion scores from Likert-type scales derived from some 26 individual measures, plus 11 demographic variables. These six scales and 11 demographic variables are presented both as quartile and percentile scores. They are also portrayed in bar charts/histograms with estimates of skewness and kurtosis. Each section contains the profile information for one time period: Baseline, Pretrial, Posttrial, 2 Month Follow-up, and 6 Month Follow-up.

As more data are entered into the database in the coming weeks the 12 month profile will be constructed, and the other five profiles will be augmented.
